

Claims

What is claimed is:

- 1 1. An apparatus, comprising:
2 a coaxial line having a center conductor separated from an outer conductor
3 by a dielectric;
4 a diode having an anode coupled to a first end of the center conductor and a
5 cathode coupled to a second end of the center conductor; and
6 a resistance coupled in series with the diode, wherein the resistance is
7 substantially equal to a selected matching termination resistance.
- 1 2. The apparatus of claim 1, wherein the diode is selected from the group
2 consisting of a p-i-n diode and a tunnel diode.
- 1 3. The apparatus of claim 1, wherein an outer diameter of the diode is less than
2 an inner diameter of the outer conductor.
- 1 4. The apparatus of claim 1, wherein the resistance is included in the diode.
- 1 5. An apparatus, comprising:
2 a plurality of substantially parallel transmission lines, each having a center
3 conductor separated from a shield by a dielectric, wherein each one of the
4 shields are coupled together, wherein a first one of the plurality of substantially
5 parallel transmission lines has a first end coupled to an input port and a second
6 end coupled to a thru port, and wherein a second one of the plurality of

7 substantially parallel transmission lines has a first end coupled to an output port
8 and a second end coupled to an isolated port.

1 6. The apparatus of claim 5, wherein a third one of the plurality of substantially
2 parallel transmission lines has a first end and a second end coupled to a
3 return terminal.

1 7. The apparatus of claim 6, wherein a first selected matching resistance is
2 coupled between the return terminal and the thru port, and wherein a second
3 selected matching resistance substantially equal to the first selected
4 matching resistance is coupled between the return terminal and the isolated
5 port.

1 8. The apparatus of claim 7, wherein the first selected matching resistance and
2 the second selected matching resistance are provided by impedance matched
3 cables coupled to the thru port and to the isolated ports, respectively.

1 9. The apparatus of claim 6, wherein a fourth one of the plurality of
2 substantially parallel transmission lines has a first end coupled to the input
3 port and a second end coupled to the thru port, wherein a fifth one of the
4 plurality of substantially parallel transmission lines has a first end coupled to
5 the output port and a second end coupled to the isolated port, and wherein a
6 sixth one of the plurality of substantially parallel transmission lines has a
7 first end and a second end coupled to a return terminal.

1 10. The apparatus of claim 6, further comprising:
2 a first group of substantially parallel transmission lines having a first end
3 coupled to the input port and a second end coupled to the thru port; and

4 a second group of substantially parallel transmission lines having a first end
5 coupled to the output port and a second end coupled to the isolated port.

1 11. The apparatus of claim 10, wherein the third one of the plurality of
2 substantially parallel transmission lines is substantially surrounded by the
3 first one and the second one of the plurality of substantially parallel
4 transmission lines, and the first group and the second group of substantially
5 parallel transmission lines.

1 12. The apparatus of claim 5, wherein selected ones of the plurality of
2 substantially parallel transmission lines include an odd multiple of one-half
3 twists.

1 13. An apparatus, comprising:
2 a plurality of substantially parallel transmission lines, each having a center
3 conductor surrounded by a first dielectric, wherein the first dielectric of each
4 one of the plurality of substantially parallel transmission lines is adjacent a first
5 shield, wherein a first one of the plurality of substantially parallel transmission
6 lines has a first end coupled to an input port and a second end coupled to a thru
7 port, and wherein a second one of the plurality of substantially parallel
8 transmission lines has a first end coupled to an output port and a second end
9 coupled to an isolated port.

1 14. The apparatus of claim 13, wherein the input port is located adjacent the
2 output port, and wherein the thru port is located adjacent the isolated port.

1 15. The apparatus of claim 13, wherein the input port is DC coupled to the thru
2 port, and wherein the output port is DC coupled to the isolated port.

- 1 16. The apparatus of claim 13, wherein the first shield is a substantially
2 continuous shield surrounding the plurality of substantially parallel
3 transmission lines, and wherein the first shield is coupled to a return
4 terminal.
- 1 17. The apparatus of claim 13, wherein the first shield is a sparse shield
2 surrounding the plurality of substantially parallel transmission lines.
- 1 18. The apparatus of claim 13, further comprising:
2 a substantially continuous second shield; and
3 a second dielectric substantially surrounded by the second shield, wherein
4 the second dielectric substantially surrounds the plurality of substantially
5 parallel transmission lines, and wherein each one of the plurality of substantially
6 parallel transmission lines is surrounded by the first shield.
- 1 19. The apparatus of claim 18, wherein the second dielectric has a dielectric
2 constant substantially equal to a dielectric constant of the first dielectric.
- 1 20. A system, comprising:
2 a charge line coupled to a first pulse source load and capable of being
3 coupled to a power source;
4 a connecting line having a first end DC-coupled to a second end capable of
5 being coupled to an output load; and
6 a switch to couple the charge line to the first end when in a first position, and
7 to decouple the charge line from the first end when in a second position, wherein
8 the connecting line has a selected impedance based on a resistance of the switch
9 and an impedance of the charge line.

- 1 21. The system of claim 20, wherein the switch resistance comprises a switch
2 arc resistance.
- 1 22. The system of claim 21, wherein the selected impedance is substantially
2 equal to a sum of the resistance of the switch and an impedance of the
3 charge line.
- 1 23. The system of claim 21, wherein a sum of the selected impedance and the
2 resistance of the switch is less than or substantially equal to an impedance of
3 the charge line.
- 1 24. The system of claim 20, wherein the switch comprises a single-pole double-
2 throw switch, and wherein the switch is to couple the charge line to the
3 power source when the switch is in the second position.
- 1 25. The system of claim 20, wherein the switch comprises a single-pole, single-
2 throw switch, and wherein the charge line remains coupled to the power
3 source when the switch is in either the first position or the second position.
- 1 26. The system of claim 20, wherein the first pulse source load comprises a
2 polarized matching load.
- 1 27. The system of claim 20, further comprising:
2 a second pulse source load capable of being coupled to the first end of the
3 connecting line.
- 1 28. The system of claim 27, wherein the second pulse source load comprises a
2 polarized load.

- 1 29. The system of claim 27, wherein an impedance of the second pulse source
2 load is substantially equal to the selected impedance.
- 1 30. The system of claim 27, wherein the impedance of the charge line is
2 substantially equal to the resistance of the switch plus about half of the
3 selected impedance.
- 1 31. A system, comprising:
2 a pulse source; and
3 a coupling apparatus having an input port capable of being coupled to the
4 pulse source, a thru port capable of being coupled to a termination, and an
5 output port capable of being coupled to an output load.
- 1 32. The system of claim 31, wherein the pulse source comprises:
2 a charge line coupled to a pulse source load and capable of being coupled to
3 a voltage source; and
4 a switch to couple the input port to the charge line in a first position and to
5 decouple the input port from the charge line in a second position.
- 1 33. The system of claim 32, wherein the switch comprises a single-pole single-
2 throw switch, and wherein the charge line remains coupled to the voltage
3 source when the switch is in either the first position or the second position.
- 1 34. The system of claim 32, wherein the switch comprises a single-pole, double-
2 throw switch, and wherein the switch is to couple the charge line to the
3 voltage source when the switch is in the second position.

- 1 35. The system of claim 32, wherein the coupling apparatus has an impedance
2 substantially equal to a resistance of the switch plus an impedance of the
3 charge line.
- 1 36. The system of claim 31, wherein the pulse source load comprises a polarized
2 matched load.
- 1 37. The system of claim 31, wherein the pulse source load comprises a
2 resistance in series with a capacitance.
- 1 38. The system of claim 31, wherein the coupling apparatus further comprises an
2 isolated port.
- 1 39. The system of claim 31, wherein the thru port is coupled to the termination.
- 1 40. The system of claim 39, wherein the termination comprises an impedance
2 matched cable coupled to the thru port.
- 1 41. A system, comprising:
2 a pulse source capable of being coupled to a microwave DC block coupled
3 to a pulse source load;
4 a coupling apparatus having an input port, a thru port coupled to a
5 termination, and an output port coupled to an output load; and
6 a switch to couple the input port to the pulse source when in a first position,
7 and to decouple the input port from the pulse source when in a second position.
- 1 42. The system of claim 41, wherein the pulse source load comprises a
2 resistance in series with a capacitance.

1 43. The system of claim 42, wherein the resistance terminates an impedance of
2 the pulse source.

1 44. The system of claim 43, wherein the pulse source comprises a charge line,
2 and wherein the impedance is substantially equal to an impedance of the
3 charge line.

1 45. A method, comprising:
2 launching a pulse into an input port of a quarter-wave directional coupler
3 having an impedance-matched thru port and an isolated port; and
4 receiving a leading edge of the pulse as a voltage spike at an output port of
5 the coupler.

1 46. The method of claim 45, wherein a center frequency of the quarter-wave
2 directional coupler is greater than about 100 MHz.

1 47. The method of claim 45, wherein launching the pulse into the input port of
2 the quarter-wave directional coupler further comprises:
3 activating a switch to couple a pulse source to the input port.

1 48. The method of claim 47, further comprising:
2 selecting an impedance of the quarter-wave directional coupler by matching
3 an impedance of the quarter-wave directional coupler to a sum of a resistance of
4 the switch and an impedance of a charge line included in the pulse source.

1 49. The method of claim 47, further comprising:
2 selecting an impedance of the quarter-wave directional coupler such that a
3 sum of the impedance of the quarter-wave directional coupler and a resistance of

- 4 the switch is less than or substantially equal to an impedance of a charge line
5 included in the pulse source.
